Lent Term 2019

T.A. Fisher

## Groups Rings and Modules: Example Sheet 3 of 4

All rings in this course are commutative with a 1.

- 1. Show that  $\mathbb{Z}[\sqrt{-2}]$  and  $\mathbb{Z}[\omega]$  are Euclidean domains, where  $\omega = \frac{1}{2}(-1 + \sqrt{-3})$ . Show also that the usual Euclidean function  $\phi(r) = N(r)$  does not make  $\mathbb{Z}[\sqrt{-3}]$  into a Euclidean domain. Could there be some other Euclidean function  $\phi$  making  $\mathbb{Z}[\sqrt{-3}]$ into a Euclidean domain?
- 2. Show that the ideal  $(2, 1 + \sqrt{-7})$  in  $\mathbb{Z}[\sqrt{-7}]$  is not principal.
- 3. Find an element of  $\mathbb{Z}[\sqrt{-17}]$  that is a product of two irreducibles and also a product of three irreducibles.
- 4. Determine whether or not the following rings are fields, PIDs, UFDs, integral domains:

$$\mathbb{Z}[X], \ \mathbb{Z}[X]/(X^2+1), \ \mathbb{Z}[X]/(2,X^2+1), \ \mathbb{Z}[X]/(2,X^2+X+1), \ \mathbb{Z}[X]/(3,X^3-X+1).$$

5. Determine which of the following polynomials are irreducible in  $\mathbb{Q}[X]$ :

 $X^4 + 2X + 2, \quad X^4 + 18X^2 + 24, \quad X^3 - 9, \quad X^3 + X^2 + X + 1, \quad X^4 + 1, \quad X^4 + 4.$ 

- 6. Let R be an integral domain. The greatest common divisor (gcd) of non-zero elements a and b in R is an element d in R such that d divides both a and b, and if c divides both a and b then c divides d.
  - (i) Show that the gcd of a and b, if it exists, is unique up to multiplication by a unit.
  - (ii) In lectures we have seen that, if R is a UFD, the gcd of two elements exists. Give an example to show that this is not always the case in an integral domain.
  - (iii) Show that if R is a PID, the gcd of elements a and b exists and can be written as ra + sb for some  $r, s \in R$ . Give an example to show that this is not always the case in a UFD.
  - (iv) Explain briefly how, if R is a Euclidean domain, the Euclidean algorithm can be used to find the gcd of any two non-zero elements. Use the algorithm to find the gcd of 11 + 7i and 18 i in  $\mathbb{Z}[i]$ .
- 7. Find all ways of writing the following integers as sums of two squares: 221, 209  $\times$  221, 121  $\times$  221, 5  $\times$  221.
- 8. By considering factorisations in  $\mathbb{Z}[\sqrt{-2}]$ , show that the only integer solutions to the equation  $x^2 + 2 = y^3$  are  $x = \pm 5$ , y = 3.
- 9. Let R be any ring. Show that the ring R[X] is a principal ideal domain if and only if R is a field. If I and J are ideals in a ring R then must the set  $\{ab : a \in I, b \in J\}$  also be an ideal in R?
- 10. Exhibit an integral domain R and a (non-zero, non-unit) element of R that is not a product of irreducibles.
- T.A.Fisher@dpmms.cam.ac.uk 1 22 February 2019

- 11. Let  $\mathbb{F}_q$  be a finite field with q elements.
  - (i) Show that the prime subfield K (that is, the smallest subfield) of  $\mathbb{F}_q$  has p elements for some prime number p. Show that  $\mathbb{F}_q$  is a vector space over K and deduce that  $q = p^k$ , for some k.
  - (ii) Show that the multiplicative group of the non-zero elements of  $\mathbb{F}_q$  is cyclic. Deduce that if  $q = p^2$  then  $\mathrm{SL}_2(\mathbb{F}_p)$  contains an element of order p + 1.

## **Further Questions**

- 12. (i) Consider the polynomial  $f = X^3Y + X^2Y^2 + Y^3 Y^2 X Y + 1$  in  $\mathbb{C}[X, Y]$ . Write it as an element of  $(\mathbb{C}[X])[Y]$ , that is collect together terms in powers of Y, and then use Eisenstein's criterion to show that f is prime in  $\mathbb{C}[X, Y]$ .
  - (ii) Let F be any field. Show that the polynomial  $f = X^2 + Y^2 1$  is irreducible in F[X, Y], unless F has characteristic 2. What happens in that case?
- 13. Show that the subring  $\mathbb{Z}[\sqrt{2}]$  of  $\mathbb{R}$  is a Euclidean domain. Show that the units are  $\pm (1 \pm \sqrt{2})^n$  for  $n \ge 0$ .
- 14. If a UFD has at least one irreducible, must it have infinitely many (pairwise non-associate) irreducibles?
- 15. Let V be a 2-dimensional vector space over a field  $\mathbb{F}_q$  of q elements, let  $\Omega$  be the set of its 1-dimensional subspaces.
  - (i) Show that  $\Omega$  has size q + 1 and  $\operatorname{GL}_2(\mathbb{F}_q)$  acts on it. Show that the kernel Z of this action consists of scalar matrices and the group  $\operatorname{PGL}_2(\mathbb{F}_q) = \operatorname{GL}_2(\mathbb{F}_q)/Z$  has order  $q(q^2 1)$ . Show that the group  $\operatorname{PSL}_2(\mathbb{F}_q)$  obtained similarly from  $\operatorname{SL}_2(\mathbb{F}_q)$  has order  $q(q^2 1)/d$  with  $d = \operatorname{gcd}(q 1, 2)$ .
  - (ii) Show that  $\Omega$  may be identified with the set  $\mathbb{F}_q \cup \{\infty\}$  in such a way that  $\operatorname{GL}_2(\mathbb{F}_q)$  acts on  $\Omega$  as the group of Möbius transformations  $z \mapsto \frac{az+b}{cz+d}$ .
- 16. Show that the groups  $SL_2(\mathbb{F}_4)$  and  $PSL_2(\mathbb{F}_5)$  defined above both have order 60. Use this and some questions from Example Sheet 1 to show that they are both isomorphic to the alternating group  $A_5$ . Show that  $SL_2(\mathbb{F}_5)$  and  $PGL_2(\mathbb{F}_5)$  both have order 120, that  $SL_2(\mathbb{F}_5)$  is not isomorphic to  $S_5$ , but  $PGL_2(\mathbb{F}_5)$  is.

[You may find it helpful to show, using the Cayley-Hamilton theorem or otherwise, that the order of an element  $I \neq A \in SL_2(\mathbb{F}_4)$  is uniquely determined by its trace.]
