## PART II REPRESENTATION THEORY SHEET 2

Unless otherwise stated, all groups here are finite, and all vector spaces are finite-dimensional over a field F of characteristic zero, usually  $\mathbb{C}$ .

- 1 Let  $\rho: G \to GL(V)$  be a representation of G of dimension d, and affording character  $\chi$ . Show that  $\ker \rho = \{g \in G \mid \chi(g) = d\}$ . Show further that  $|\chi(g)| \leq d$  for all  $g \in G$ , with equality if and only if  $\rho(g) = \lambda I$ , a scalar multiple of the identity, for some root of unity  $\lambda$ .
- Let  $\chi$  be the character of a representation V of G and let g be an element of G. If g is an involution (i.e.  $g^2 = 1 \neq g$ ), show that  $\chi(g)$  is an integer and  $\chi(g) \equiv \chi(1)$  mod 2. If G is simple (but not  $C_2$ ), show that in fact  $\chi(g) \equiv \chi(1)$  mod 4. (Hint: consider the determinant of g acting on V.) If g has order 3 and is conjugate to  $g^{-1}$ , show that  $\chi(g) \equiv \chi(1)$  mod 3.
- 3 Construct the character table of the dihedral group  $D_8$  and of the quaternion group  $Q_8$ . You should notice something interesting.
- 4 Construct the character table of the dihedral group  $D_{10}$ .

Each irreducible representation of  $D_{10}$  may be regarded as a representation of the cyclic subgroup  $C_5$ . Determine how each irreducible representation of  $D_{10}$  decomposes into irreducible representations of  $C_5$ .

Repeat for  $D_{12} \cong S_3 \times C_2$  and the cyclic subgroup  $C_6$  of  $D_{12}$ .

5 Construct the character tables of  $A_4$ ,  $S_4$ ,  $S_5$ , and  $A_5$ .

The group  $S_n$  acts by conjugation on the set of elements of  $A_n$ . This induces an action on the set of conjugacy classes and on the set of irreducible characters of  $A_n$ . Describe the actions in the cases where n = 4 and n = 5.

6 A certain group of order 720 has 11 conjugacy classes. Two representations of this group are known and have corresponding characters  $\alpha$  and  $\beta$ . The table below gives the sizes of the conjugacy classes in the group and the values which  $\alpha$  and  $\beta$  take on them.

Prove that the group has an irreducible representation of degree 16 and write down the corresponding character on the conjugacy classes.

7 The table below is a part of the character table of a certain finite group, with some of the rows missing. The columns are labelled by the sizes of the conjugacy classes, and  $\gamma = (-1 + i\sqrt{7})/2$ ,  $\zeta = (-1 + i\sqrt{3})/2$ . Complete the character table. Describe the group in terms of generators and relations.

- Let x be an element of order n in a finite group G. Say, without detailed proof, why
  - (a) if  $\chi$  is a character of G, then  $\chi(x)$  is a sum of nth roots of unity;
  - (b)  $\tau(x)$  is real for every character  $\tau$  of G if and only if x is conjugate to  $x^{-1}$ ;
  - (c) x and  $x^{-1}$  have the same number of conjugates in G.

Prove that the number of irreducible characters of G which take only real values (socalled real characters) is equal to the number of self-inverse conjugacy classes (so-called real classes).

9 A group of order 168 has 6 conjugacy classes. Three representations of this group are known and have corresponding characters  $\alpha$ ,  $\beta$  and  $\gamma$ . The table below gives the sizes of the conjugacy classes and the values  $\alpha$ ,  $\beta$  and  $\gamma$  take on them.

Construct the character table of the group.

You may assume, if needed, the fact that  $\sqrt{7}$  is not in the field  $\mathbb{Q}(\zeta)$ , where  $\zeta$  is a primitive 7th root of unity.

The character table thus obtained is in fact the character table of the group  $G = PSL_2(7)$ of  $2 \times 2$  matrices with determinant 1 over the field  $\mathbb{F}_7$  (of seven elements) modulo the two scalar matrices. Deduce directly from the character table that G is simple<sup>1</sup>.

- 10 The group  $M_9$  is a certain subgroup of the symmetric group  $S_9$  generated by the two elements (1,4,9,8)(2,5,3,6) and (1,6,5,2)(3,7,9,8). You are given the following facts about  $M_9$ :
  - there are six conjugacy classes:
  - $C_1$  contains the identity.
- For  $2 \leq i \leq 4$ ,  $|C_i| = 18$  and  $C_i$  contains  $g_i$ , where  $g_2 = (2,3,8,6)(4,7,5,9)$ ,  $g_3 = (2,3,8,6)(4,7,5,9)$ (2,4,8,5)(3,9,6,7) and  $g_4 = (2,7,8,9)(3,4,6,5)$ .
  - $|C_5| = 9$ , and  $C_5$  contains  $g_5 = (2,8)(3,6)(4,5)(7,9)$   $|C_6| = 8$ , and  $C_6$  contains  $g_6 = (1,2,8)(3,9,4)(5,7,6)$ .

  - every element of  $M_9$  is conjugate to its inverse.

Calculate the character table of  $M_9$ . [Hint: You may find it helpful to notice that  $g_2^2 = g_3^2 = g_4^2 = g_5.$ 

Let a finite group G act on itself by conjugation. Find the character of the corresponding permutation representation.

<sup>&</sup>lt;sup>1</sup>It is known that there are precisely five non-abelian simple groups of order less than 1000. The smallest of these is  $A_5 \cong \mathrm{PSL}_2(5)$ , while G is the second smallest. The others are  $A_6$ ,  $\mathrm{PSL}_2(8)$  and  $\mathrm{PSL}_2(11)$ . It is also known that for  $p \ge 5$ ,  $PSL_2(p)$  is simple.

- 12 Consider the character table Z of G as a matrix of complex numbers (as we did when deriving the column orthogonality relations from the row orthogonality relations).
- (a) Using the fact that the complex conjugate of an irreducible character is also an irreducible character, show that the determinant  $\det Z$  is  $\pm \det \bar{Z}$ , where  $\bar{Z}$  is the complex conjugate of Z.
  - (b) Deduce that either  $\det Z \in \mathbb{R}$  or  $\det Z \in i\mathbb{R}$ .
- (c) Use the column orthogonality relations to calculate the product  $\bar{Z}^T Z$ , where  $\bar{Z}^T$  is the transpose of the complex conjugate of Z.
  - (d) Calculate  $|\det Z|$ .
