Page 18: Exercise 2.4 (i) Replace 4 by 2. Prove the incremental inequality

\[ |f_P(u + h) - f_P(u)|^2 \leq 2(1 - \Re f_P(h)). \]

Page 21: Proposition 3.2.1 (i) Replace \( nt > -1 \) by \( nt < 1 \).

Page 22: Line 3 Replace ‘if \( n^{\alpha} > x \),’ by ‘if \( n^{\alpha-1} > x \).’

Page 26: Line 10 ‘... the points \((x_1, f(x_1)), \ldots, (x_n, f(x_n))...\).’

Page 41: Exercise 4.1 (ii) Let \( I_n = \int_0^{\pi/2} \sin^n \theta \, d\theta \).

Page 45, Line 14 Thus \( L^p \) is a vector space.

Page 50: Line 1 ‘...w = (u, v) = (f^p, g^p).’

Page 52: Statement of Corollary 5.4.2 Replace \( \Omega_1 \) and \( \Omega_2 \) by \( X_1 \) and \( X_2 \).

Page 60: Line 3*

\[ f(x) = \int_{-\infty}^{x_j} \frac{\partial f}{\partial x_j}(t, x^i) \, dt = -\int_{x_j}^{\infty} \frac{\partial f}{\partial x_j}(t, x^i) \, dt, \]

Page 65: Line 4 In the second integral, replace \( dy \) by \( dx \).

Page 66: Statement of Theorem 5.10.2 ...and \( b \in l_p'(\mathbb{Z}^+),... \)

Page 68: Exercise 5.11 ‘Show that \( \psi \) and \( \chi \)...’

Page 71: Line 16 ‘Then \( f_A \) is zero outside \( A \).’

Page 75: Line 3 ‘Suppose that \( \Phi(t) = \int_0^t \phi(s) \, ds \).’

Page 113: Line 5 ‘measured’, not ‘measures’.

Pages 139: Line 7 Replace this sentence with ‘If \( g \) is a non-zero simple function, then just as in the construction of \( F \) above, we can construct \( G \)
such that $G(\theta) = g$, $G$ is continuous on $\bar{S}$, analytic on $S$ and bounded in $B_0 + B_1$ on $\bar{S}$.

Page 141: Lines 9*-8* If we set $\theta = p/q' = 1 - p/r$ we find that...

Page 147: Line 1 Replace ‘the Hausdorff-Young inequality’ by ‘Theorem 9.7.1’.

Page 148: Line 5 Add a subscript $p$ to each of the four norms in this line.

Page 149: Statement of Lemma 9.8.1 If $1 < p < \infty$, there exists $C_p > 0$ such that if $s, t \in \mathbb{R}$ then ...

Page 168: Line 6 $Q_t(f) = \ldots$

Page 209: Lines 9* and 8* Replace ‘$y_B$’ by ‘$x_B$’

Page 209: Line 4* This line is badly wrong; it should be

$$\leq (E_N)(E_{N-1}(\|u_p + \epsilon_N r q p \|_E^{p/q'}))^{1/q}$$

Page 212: Line 14 This should be:

$$2\|f\|_2^2 = 2 \langle f, f \rangle \leq \mathcal{E}(f) + 2(E(f))^2 + \sum_{i=1}^d \hat{f}_i^2.$$
\[
\begin{align*}
\leq & \frac{\lambda^2}{2} \sum_{\omega} \left( \sum_{(\eta, \eta' : \eta \sim \omega)} (f(\eta) - f(\omega))^2 \right) e^{\lambda f(\omega)} \\
= & \frac{\lambda^2}{2} \mathbb{E}(\|\nabla f\|^2) e^{\lambda f} \leq \frac{\lambda^2}{2} \mathbb{E}(e^{\lambda^2/2}) = \frac{\lambda^2 H(\lambda)}{2}
\end{align*}
\]

Thus, applying the logarithmic Sobolev inequality,

\[
\text{Ent}(e^{\lambda f}) \leq 2\mathcal{E}(e^{\lambda^2/2}) = \frac{1}{2} \mathbb{E}((\nabla e^{\lambda^2/2})^2) \leq \lambda^2 H(\lambda)/4.
\]

Page 216: Statement of Corollary 13.4.2. Replace \( h(\omega, A) \) by \( h_A(\omega) \).

Page 228: Statement of Theorem 13.10.3 Replace \( e^{-\lambda^2/4} \) by \( e^{-\lambda^2/2} \).

Page 228: Statement of Corollary 13.10.1 ’Then \( f \) is sub-Gaussian with index 1:’ Replace \( e^{-r^2} \) by \( e^{-r^2/2} \).

My thanks to Nick Bingham for pointing out the errors on pages 113, 275 and 329. My thanks also to Mark Veraar for pointing out many errors, particularly those relating to the logarithmic Sobolev inequalities, and for helping me correct them. My thanks also to Bill Johnson for pointing out the need to correct the proof of Theorem 9.3.1, and to Hassane Kone and Yan Zhu for pointing out other errors.

**Comments**

Pages 103-106 The Hardy-Riesz inequality is usually called Hardy’s inequality. Its gestation, and its relation to Hilbert’s absolute inequality, make a complicated and fascinating story. A beautiful account is given by
Kufner, Maligranda and Persson (2006). I am grateful to Dennis Bernstein for bringing this to my attention, and also for pointing out some of the errors listed above.

Page 148: Theorem 9.8.1 This is a special case of Bonami’s inequality (Proposition 13.1.1) which also shows that we can take \( C_p = p - 1 \) and that the inequality is then sharp. A full account of uniform convexity of the \( L^p \) spaces, and the operator ideals \( S_p \) introduced in Section 15.10, is given in the magisterial paper:

This paper also appears in M. Loss and M.B. Ruskai (eds) (2002-3). Inequalities, Selecta of Elliott H. Lieb, (Springer) This contains a wealth of further inequalities.

Page 151: Exercise 9.3 The hint is not very helpful: here is a proof.

Let \( h(x) = \int k(x-y)g(y)\,d\mu(y) \). Then since \( q/p' + q/r = 1 \) and \( p/q' + p/r = 1 \)

\[
|h(x)| \leq \int |k(x-y)||g(y)|\,d\mu(y) \\
= \int |k(x-y)|^{q/p'}|g(y)|^{p/q'}|k(x-y)|^{q/r}|g(y)|^{p/r}\,d\mu(y).
\]

Now \( 1/p' + 1/q' + 1/r = 1 \), and so, by Proposition 5.4.1,

\[
|h(x)| \leq \|k\|_{q'}^{q/p'} \|g\|_p^{p/q'} \left( \int |k(x-y)|^q|g(y)|^p\,d\mu(y) \right)^{1/r},
\]

so that

\[
\|h\|_r \leq \|k\|_{q'}^{q/p'} \|g\|_p^{p/q'} \left( \int (\int |k(x-y)|^q|g(y)|^p\,d\mu(y))\,d\mu(x) \right)^{1/r} \\
= \|k\|_{q'}^{q/p'} \|g\|_p^{p/q'} \|k\|_{q'}^{q/r} \|g\|_p^{p/r} = \|k\|_q \cdot \|g\|_p.
\]

Now suppose that \( k \) is a positive integer, and suppose that \( f \in L^{2k/(2k-1)}(G) \). Let \( g \) be the \( k \)-fold convolution of \( f \) with itself. Use Young’s inequality, extended to \( k \) terms, to show that \( \|g\|_2 \leq \|f\|_2^{k/(2k-1)} \). But \( \tilde{g} = (\hat{f})^k \), so that,
using the Plancherel theorem (Theorem 9.5.1),

\[ \| \hat{f} \|_{2k}^2 = \| \langle \hat{f} \rangle_{k/2} \|_{2}^{1/k} \leq \| g \|_{2}^{1/k} \leq \| f \|_{2k/(2k-1)}. \]

This is what Young (1912) proved. Thus Young proved the Hausdorff-Young inequality for \( L^r \) when \( r' \) is an even integer.

Hausdorff (1923) extended the result to all \( 1 < r < 2 \), by using an optimization argument involving Lagrange’s undetermined multipliers to show that if the result holds for \( r \), then it holds for \( s \), where \( s' = r'/2 + 1 \). Thus it holds for all \( r \), where \( r \) is a dyadic rational greater than 2: the general result then follows by continuity.

**Pages 263-265:** Khinchine’s inequality can be applied effectively to prove Orlicz’ inequality.

**Theorem 0.1 (Orlicz’ inequality)** Suppose that \( \Omega, \Sigma, \mu \) is a probability space, that \( 1 \leq p < 2 \) and that \( \sum_{n=1}^{\infty} f_n \) is an unconditionally convergent sequence in \( L^p(\mu) \), so that

\[
\sup \left\{ \sum_{n=1}^{\infty} \left| \int g f_n \, d\mu \right| : \|g\|_{p'} \leq 1 \right\} = \sup \left\{ \left\| \sum_{n=1}^{\infty} b_n f_n \right\|_p : \|b\|_{\infty} \leq 1 \right\} = M < \infty.
\]

Then \( \sum_{n=1}^{\infty} \| f_n \|_p^2 \leq 2M^2 \).

*Proof* Let \( N \in \mathbb{N} \). Then, first using Corollary 4.5.2 and then Khintchine’s inequality,

\[
\sum_{n=1}^{N} \| f_n \|_p^2 = \sum_{n=1}^{N} \left( \int \| f_n \|_p^2 \, d\mu \right)^{2/p} \leq \left( \int \left( \sum_{n=1}^{N} \| f_n \|_p^2 \right)^{p/2} \, d\mu \right)^{2/p} \leq \left( \int \left( \mathbf{E} \left( \sum_{n=1}^{N} \epsilon_n f_n \right)^{p} \right) \, d\mu \right)^{2/p} = 2\mathbf{E} \left( \int \left( \sum_{n=1}^{N} \epsilon_n f_n \right)^{p} \, d\mu \right)^{2/p} \leq 2M^2.
\]
Corollary 0.1 Suppose that \((f_n)_{n=1}^{\infty}\) is an orthonormal basis for \(L^2(\mu)\), that \(1 \leq p < 2\) and that \(\inf_n \|f_n\|_p > 0\). Then \((f_n)\) is not an unconditional basis for \(L^p(\mu)\).

Proof For if \(f = \sum_{n=1}^{\infty} a_n f_n\) converges, then \(\sum_{n=1}^{\infty} |a_n|^2 \|f_n\|_p^2 < \infty\), and so \(\sum_{n=1}^{\infty} |a_n|^2 < \infty\). Consequently, the sum \(\sum_{n=1}^{\infty} a_n f_n\) converges in \(L^2(\mu)\) norm, and so \(f \in L^2(\mu)\). Thus \(L^2(\mu) = L^p(\mu)\), which is not possible.

Corollary 0.2 Suppose that \((f_n)_{n=1}^{\infty}\) is an orthonormal basis for \(L^2(\mu)\), that \(2 < p < \infty\) and that \((f_n)\) is bounded in \(L^p\). Then \((f_n)\) is not an unconditional basis for \(L^p(\mu)\).

Proof If it were, then, by duality, \((f_n)\) would be an unconditional basis of \(L^{p'}(\mu)\), and \(\inf_n \|f_n\|_{p'}\) would be strictly positive.

Corollary 0.3 If \(G\) is a compact abelian group, with Haar measure \(\mu\), and \(\{\gamma_n : n \in \mathbb{N}\}\) is the set of characters of \(G\) then \((\gamma_n)\) is an unconditional basis for \(L^p(\mu)\) (where \(1 \leq p < \infty\)) if and only if \(p = 2\).

Proof For \((\gamma_n)\) is an orthonormal basis for \(L^2(\mu)\), and \(\|\gamma_n\|_p = 1\) for all \(1 \leq p < \infty\).
