

**End of Global Sea Level Rise**  
Space and Science Research Corporation  
Friday, August 23, 2013

In a news conference held near Miami, Florida last night, the Space and Science Research Corporation (SSRC) announced that the global threat of sea level rise caused by decades of global warming is ending. Speaking to cheering supporters from several groups from the general Miami area, SSRC President Mr. John Casey issued a formal declaration of the end of global sea level rise during a presentation in which he discussed the vital role the Sun plays in climate change and how the past growth in sea levels was caused by the Sun and not mankind. The event was sponsored by the American Citizens League. The declaration read:

As a result of the Sun entering a hibernation phase, the Space and Science Research Corporation hereby declares that the past two hundred years of global sea level rise is expected to end no earlier than mid-2014 and no later than 2020. After that time, global sea levels are expected to begin a long term period of decline, lasting at least through the decade of the 2030s. The estimated global sea level decline during that period will range from 20 to 25 cm from current levels.
